

# FLYING OPTICS BEAM DELIVERY

## A CLEVER DESIGN!

The flying optics laser delivery system is ideal for large format cutting and marking applications. Your product and the laser source both remain stationary while the beam is directed from overhead on a high-speed, low-mass gantry system that houses the mirror and focusing lens. This results in extremely high acceleration rates and better accuracy and repeatability. This concept may be applied to virtually any type of laser system to satisfy any industrial cutting, welding or marking application.
